# Approximate String Matching by Position Restricted Alignment 

Manish Patil<br>Xuanting Cai<br>Sharma V. Thankachan<br>Rahul Shah<br>Seung-Jong Park<br>David Foltz

Louisiana State University,

## Problem Definition

$\square$ Given a non-negative integer T , a string $r$ and a collection of strings $S$, an approximate string query finds all pairs $(r, s)$ with $s \in S$ such that $e d(r, s) \leq \tau$

| Id | String | ed $(r, s)$ |
| :--- | :--- | :---: |
| $s_{1}$ | AAACTGTGC | 1 |
| $s_{2}$ | AACTGTC | 1 |
| $s_{3}$ | CTAATCT | 6 |
| $s_{4}$ | GCGTC | 4 |
| $s_{5}$ | GCGTCGT | 5 |
| $s_{6}$ | TCAACCGTACG | 4 |
| $s_{7}$ | TCCTATAAA | 6 |
| $s_{8}$ | TCCAATAAA | 7 |

$$
\begin{aligned}
& \mathrm{T}=2 \\
& r=\mathrm{AACTGTGC}
\end{aligned}
$$

## q-gram Based Approach

- If query $r$ matches a string $s$ withterrors and if we split the pattern $r$ in $\mathrm{T}+\mathrm{t}$ disjoint pieces arbitrarily, then at-least $t$ pieces must be present in $s$ as its substring with no errors

$$
\begin{array}{lll}
\checkmark \quad s_{2}=\mathrm{AA} A \mathrm{CT} \mathrm{GT} \mathrm{GC} & q=2 \\
\times \quad s_{8}=\mathrm{TCCAA} T A A A & T=2 \\
& r=\mathrm{AA} \mathrm{GT} \mathrm{GT} \mathrm{GC}
\end{array}
$$

## q-gram Based Approach

$\square$ Maintain inverted lists for all q-grams in given collection of strings $S$

- Given a query string $r$
- Partition the query string to obtain q-grams
- Retrieve the inverted lists corresponding to each of the q-gram
- Apply filtering techniques to prune strings and shrink inverted lists
- Merge the lists to obtain candidate strings
- Verify each of the candidate string for edit distance thresholdt

## Observations

$\square$ Dilemma of choosing $q$ (fixed at the time of index construction)

- Maintain inverted lists of grams for all values of $q$
$\square$ Applying filters to prune out the candidate can be expensive in terms of computational cost
- Integrate the inverted lists storage with filtering techniques enabling us to auto-filter the inverted lists

## Suffix Tree

$\square$ Suffix tree is a compact trie storing the suffixes of the input string

- O(n) words space
- Locate inverted list corresponding to the given query $r$, in $O(|r|)$ time

Suffix tree for string BANANA

- Generalized Suffix Tree (GST) is a compact trie which stores all suffixes of all strings in a given collection $S$

## Wavelet-Tree

## Wavelet-Tree

$\square$ WT is an ordered balanced binary tree where

- each leaf is labeled with a symbol in $\Sigma$
- leaves are sorted from left to right
- each internal node represents an alphabet set $\boldsymbol{\Sigma}^{\prime}$, and is associated with a bit-vector (along with its rank-select structure)
- each node partitions its alphabet set among the two children (almost) equally, such that all symbols represented by the left child are numerically smaller than those represented by the right child
$\square O(n)$ words space
$\square$ Query time for 2D range searching is $O(\log \Sigma)$ per output

## Basic Framework for Query Answering

$\square$ Maintain GST for given collection of strings $S$
$\square$ Given a query string $r$

- Divide $r$ into $T+1$ segments each with length floor(|r|( $T+1)$ ) except the last $|r| \bmod (\mathrm{T}+1)$ segments which have length ceil( $|r|(\mathrm{T}+1)$ )
- Search for each partition in the GST to retrieve its inverted list
- Apply Length and Position filtering to prune strings
- Merge the lists using scan-count algorithm to obtain candidate strings
- Verify each of the candidate string for edit distance thresholdtusing linear time algorithm

## Length Filtering

$\square$ The length of a string $s$ that is within edit distancetfrom query string $r$ is bounded by the equation: $\| r|-|s|| \leq T$

| Id | String | Length |
| :--- | :--- | :---: |
| $s_{1}$ | AAACTGTGC | 9 |
| $s_{2}$ | AACTGTC | 7 |
| $s_{3}$ | CTAATCT | 7 |
| $s_{4}$ | GCGTC | 5 |
| $s_{5}$ | GCGTCGT | 7 |
| $s_{6}$ | TCAACCGTACG | 11 |
| $s_{7}$ | TCCTATAAA | 9 |
| $s_{8}$ | TCCAATAAA | 9 |

$$
\begin{aligned}
& t=2 \\
& r=A A C T G T G C \\
& |r|=8 \\
& 6<=|s|<=10
\end{aligned}
$$

## Position Filtering

$\square$ Let $s$ contains a substring $s^{\prime}$ that matches substring $r$ ' of $r$
$\square$ Let $s^{\prime}$ have starting position $s_{s p}^{\prime}$ in $s$ and substring $r$ ' has starting position $r_{s p}^{\prime}$ in $r$

- If alignment of $r$ and $s$ produced by matching $r^{\prime}$ and $s^{\prime}$ gives edit distance less than or equal to threshold then $\left|r_{s p}^{\prime}-s_{s p}^{\prime}\right| \leq T$

| Id | String |
| :--- | :--- |
| $s_{1}$ | AAACTGTGC |
| $s_{2}$ | AACTGTC |
| $s_{3}$ | CTAATCT |
| $s_{5}$ | GCGTCGT |
| $s_{7}$ | TCCTATAAA |
| $s_{8}$ | TCCAATAAA |

$$
\begin{gathered}
r=\text { AA CTGTGC } \\
\mathrm{s}_{7}=\mathrm{TCCTAT} A A \mathrm{~A} \\
r=\mathrm{AA} \mathrm{CTGTGC} \\
\mathrm{~s}_{3}=\mathrm{CT} \text { AA TCT }
\end{gathered}
$$

## Basic Framework for Query Answering

## Position Restricted Alignment

$\square$ Consider alignment of $r$ and $s$ produced by matching $r^{\prime}$ and $s^{\prime}$

- $s^{\prime}$ is a substring of $s$ and $r^{\prime}$ is substring of $r$
- $s^{\prime}$ has starting position $s_{s p}^{\prime}$ in $s$ and $r_{s p}^{\prime}$ be the same for $r^{\prime}$
- Partition $r$ in to $r_{\text {left }} r^{\prime}, r_{\text {right }}$ around $r^{\prime}$ and similarly partition $s$ as well

$$
\begin{aligned}
& r=r_{\text {left }} r^{\prime} r_{\text {right }} \\
& s=s_{\text {left }} \\
& s^{\prime} s_{\text {right }}
\end{aligned}
$$

$$
e d(r, s) \leq \mathrm{T}
$$

$$
\begin{aligned}
r & =\text { AA CTGTGC } \\
x \quad \mathrm{~s}_{3} & =\mathrm{CT} \mathrm{AA} \mathrm{TCT}
\end{aligned}
$$

$e d\left(r_{\text {left }}, s_{\text {left }}\right)+e d\left(r_{\text {right }}, S_{\text {right }}\right) \leq T$
$\left|r_{s p}^{\prime}-s_{s p}^{\prime}\right|+\left|\left(|r|-r_{s p}^{\prime}\right)-\left(|s|-s_{s p}^{\prime}\right)\right| \leq \tau$

## Level 1: Wavelet-Tree

| Starting Position |  | $\left.\begin{array}{c} 8 \\ \left(s_{7}, 9\right. \end{array}\right)$ | $\begin{gathered} 8 \\ \left(s_{8,} 9\right. \end{gathered}$ | $\begin{gathered} 7 \\ \left(s_{7}, 9\right. \\ ) \end{gathered}$ | $\begin{gathered} 7 \\ \left(s_{1}, 9\right. \\ ) \end{gathered}$ | $\begin{gathered} 1 \\ \left(s_{1}, 9\right) \end{gathered}$ | $\begin{gathered} 3 \\ \left(s_{6}, 11\right) \end{gathered}$ | $\begin{gathered} 2 \\ \left(s_{1}, 9\right) \end{gathered}$ | $\begin{gathered} 1 \\ \left(s_{2}, 7\right) \end{gathered}$ | $\begin{gathered} 4 \\ \left(s_{8}, 9\right) \end{gathered}$ | $\begin{gathered} 3 \\ \left(s_{3}, 7\right) \\ \Sigma=\{1 \end{gathered}$ | 7) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | ... | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | .. |
|  |  |  |  |  |  |  |  | T= 2 |  |  |  |  |
|  |  |  |  |  |  |  |  | $r=\mathrm{AA}$ CTG TGC |  |  |  |  |
|  |  |  |  |  |  |  |  | $\left\|1-s_{s p}^{\prime}\right\|<=2$ |  |  |  |  |

## Level 2: Wavelet-Tree

## $\Sigma=\{3\}$

(Length -
Starting Position)

| 8 | 4 |
| :---: | :---: |
| $\left(s_{6}, 11\right)$ | $\left(s_{3}, 7\right)$ |

$$
\begin{gathered}
\left|r_{s p}^{\prime}-s_{s p}^{\prime}\right|+\left|\left(|r|-r_{s p}^{\prime}\right)-\left(|s|-s_{s p}^{\prime}\right)\right| \leq \mathrm{T} \\
2+\left|7-\left(|s|-s_{s p}^{\prime}\right)\right| \leq 2
\end{gathered}
$$

$$
|s|-s_{s p}^{\prime}<=0
$$

## Performance Bottleneck

$\square$ Particular string $s$ can have multiple possible alignments with $r$ based on partition $r^{\prime}$

- Use of scan-count of merging inverted lists

Results in artificial candidate strings increasing verification cost

- Special care has to be taken to increment count for a string s only once for each of the partition of $r$
- easy to be taken care of theoretically
- practically it is an additional cost to ensure uniqueness

## Selectively Enforcing Uniqueness

$\square$ Goal: To balance cost of ensuring uniquess vs increased cost of verification due to artificial candidate strings

- Maintain a dictionary of GST nodes (strings) such that
- dist(u)/size( $u$ ) $<U Q_{\text {min }}$, where dist( $u$ ) is the number of distinct leaves (string ids) in the subtree of node $u$ and size $(u)$ is the total number of leaves in subtree of node u

If $r$ ' is in the dictionary filter out duplicate string ids

## Other Practical Improvements

- Incorporating count filtering
- Partition query $r$ intor+ t disjoint pieces where t depends on query string length
- Variable length partitioning
- Greedy partitioning of query string $r$ guided by the dictionary of GST nodes
$\square$ Filtering based on frequency distance
- If two strings are similar, then the frequency of the alphabet symbols in two strings should also be similar

## Experimental Setup

$\square$ Public code libraries used

- http://www.un-iulm.de/in/theo/research/sdsl.html
- http://pizzachili.dcc.uchile.cl/indexes.html
- C++ Implementation (gcc 4.4 and above)
$\square$ Ubuntu machine with an Intel core i5 (quad core) 1.6 GHz processor and 8GB RAM

## Results

I-CF(-): т+ t partitioning with mandatory uniqueness check

I-CF(+): $\uparrow+\mathrm{t}$ partitioning with selective uniqueness check

I-PRA: T+ 1 partitioning (No uniqueness check required)

## Results

I-CF(+): $\mathrm{T}+\mathrm{t}$ partitioning with selective uniqueness check

I-FDF: I-CF(+) with frequency distance filtering

## Questions?

## THANK YOU!
